Sources: High-technology exports as a percentage of total exports are from World Bank (2003).

Exports by SITC category as a percentage of total manufactured exports are authors' calculations based on data from Source OECD.

Notes: SITC 5 is chemicals and related products; SITC 6 is manufactured goods classified chiefly by material (including rubber, textiles, iron and steel); SITC 7 is machinery and transport equipment (including telecommunications, electrical, computers, other electronics, and automobiles); SITC 8 is miscellaneous manufactured articles (including furniture, apparel, footwear, and instruments). NA means not available.

Notes: Statistics computed using the generalized Chow test for poolability from Baltagi (2001). The sample period is 1985-2004 after using 1983-84 data for lags and differences. The estimation is done with all variables in log differences using OLS.

Notes: Each test assumes an individual unit root process with an intercept but no trend. The null hypothesis is a unit root (p -values in parentheses). Sample period 1983-2004 (including lags and differences); lag selection based on the Schwartz Information Criterion. Probabilities for Fisher tests are computed using an asymptotic χ^2 distribution; other tests assume asymptotic normality (all tests based on Newey-West bandwidth selection using the Bartlett kernel). See section 3.2 of text and Table 3 for variable definitions and sources.
